Consolor Lynx Seating System

The **Consolor Lynx Seating System** is made of interlocking plastic X shape components which are able to slide over each other, which can be adjusted to allow its shape to expand or contract, which enables it to form complex three dimensional shapes. The Lynx sheet can be draped over a plaster cast of the client, achieved during the moulding process (see assessments section for more details) or formed around the body of the client directly. The locking screws are then tightened and the sheet holds its shape. An aluminium frame is formed around the contours to make it rigid and strong enough to be mounted onto a wheelchair. The seat has a padded upholstery cover, which is tailored specifically to the individual shape of the seat. The cover is easily removed for cleaning.

Specifics of Lynx Seating Systems

- Good air circulation is achieved through the Lynx components.
- Offers a firm supportive surface.
- Seats are usually made in one piece.
- Adjustable, by removing/adding or adjusting components, changes in the client's size and shape can be accommodated.
- Can be easily cleaned and has removable covers.
- Due to the components that make up the Lynx, seats can be heavy.

- Large flowing contours can be formed.
- The Lynx components should be checked regularly and tightened where necessary.
